

# ARTIFICIAL INTELLIGENCE AND ONLINE LEARNING ("UPDATED" / 27 MAY)

EVON LAVEA | RICHARD LEE

## Proposal and direction of our project

For our proposal we have agreed to cover the topic surrounding AI and online learning within the education and learning sector.

### The 3 main areas to explore:

- Computers in education and learning
- Online learning and COVID19
- Long term impacts of online learning

Given the recent global events over the last few years, along with the growing popularity of artificial intelligence across all sectors, we believe that it is important and necessary to look further into these areas and explore the new impacts and trends within the education and learning environment. As a society, we have seen and experienced major events in the last several years that shaped how we currently operate on a day-to-day basis, with changes seen across all industries. Because of this, we believe that it is important to investigate and highlight how these changes have impacted students. What trends are we seeing already? Is AI a detriment or a useful tool for students? What is there to say about Covid-19 and the shift to online learning? Lastly, what are some of the potential long-term impacts of online learning? Numerous studies and articles have investigated and discussed the impacts that these different topics have had on students so far.
